

OPC Coordinated Prevention of Congenital Syphilis: Prenatal Providers

Join us for an open webinar!

The Oregon Perinatal Collaborative (OPC), in partnership with Comagine Health and with funding from the Oregon Health Authority, is leading a statewide initiative to prevent congenital syphilis through coordinated screening, treatment, and follow-up of pregnant patients in emergency department and community settings. This on-demand series presents setting-specific best-practice guidance developed with emergency departments, local public health authorities, and community partners across Oregon.

Register here!

OBJECTIVES

Prenatal care is the first and best opportunity to prevent congenital syphilis, but missed screening, delayed or incomplete treatment, and confusing test results can lead to preventable cases. This session reviews current state recommendations for syphilis in pregnancy and covers:

- Frequency of syphilis screening in pregnancy
- Interpreting treponemal and nontreponemal serologies, including discordant results under reverse-sequence algorithms
- Staging, treatment timing, and adequacy relative to delivery
- Managing missed doses, partner treatment, and serologic follow-up

It also addresses how prenatal care teams can coordinate with local public health to support continuity for patients first identified in the ED or on labor and delivery, particularly those with limited or late prenatal care.

Webinars will be available on demand after the listed time through the same registration link.
